

BS&A Municipal Solutions

Highlights

Looking for a way to increase productivity while decreasing your impact on the environment? Do you need software with robust reporting and integration with Microsoft Office, allowing you to get the most out of your data? BS&A Software has the resources you need to accomplish all of this and more.

AccessMyGov - Dashboard

BS&A Software's AMG-Dashboard allows both municipal employees and the public to access important financial information and accomplish tasks online, all of which used to require a phone call or a trip to the municipal office. Municipal employees can use it to run reports and approve purchase orders and accounts payable invoices, and how the public can view financial data and submit requests for action, such as pot-hole fills and clean-up, among other things

Office Integration

BS&A Software's suite of products works with Microsoft Office to improve your workflow and data tracking; exporting to and importing from Excel, generating letters in Word and attaching them to your BS&A data, and dumping generated reports directly to Outlook.

Simplified Report Creation

Your financial system includes a wealth of information. The key to making the system work for you is to provide a fast and efficient means to extract the information you need. BS&A Software makes creating reports with the data you need simple for both novice and experienced users; standard reports' drill-down feature, the customization of columns, email capability, exports to Microsoft Excel, and Report Profiles, a collection of reports that can be generated at one click.

Paperless Process

A growing concern of local governments today is doing more with less. As such, local governments are increasingly looking to bring about change in their policies and practices for the sustainable future. Going-green and/or paperless initiatives are popular at conception, but commonly fail with execution. BS&A's software applications solve the problem by providing paperless communication among departments in your municipality, allowing for electronic timesheet entry by your staff, allowing the public to view and pay invoices online, and by providing a way for you and your vendors to exchange submissions to do business and get paid electronically..

Employee Self Service

Employee Self Service is a collection of online services that allows employees to view prior checks, request changes to personal employment information, check leave balances, enter and view time sheets, and perform many other important employee housekeeping chores. This service helps minimize the time spent fulfilling information requests in-house, thus leveraging valuable human resource capabilities.

Planning, Zoning, and Engineering Module

BS&A's Planning, Zoning, and Engineering module allows for the tracking of all of your unique process steps, documents, and related activities. It has been designed to be customized, as each department's process can be quite intricate; documents and email can be put to work electronically, by triggering specific events to happen, all of which are part of a workflow designed to ease your data entry and extraction.

Online Permit Applications

BS&A's AccessMyGov, or AMG, web service offers a variety of ways for municipal employees and the public to look up and exchange data, easing the initiative used by many municipalities to go green; permit applications may be submitted and tracked online, eliminating much of the need for phone calls and/or visits to the municipal offices.

Online Inspections

Online Inspection Scheduling is designed to save time and resources when scheduling inspections with your Building Department. It is compatible with a variety of mobile devices, and can be used by staff, homeowners, and contractors alike, any time, day or night. Scheduling an Online Inspection is extremely straightforward and will save you from excessive phone calls and scheduling difficulties.

Seamless GIS Integration

BS&A's GIS integration allows for a direct link between your data and GIS maps, giving you a very powerful tool to view data, plot various datasets, and quickly view neighboring records. The database is linked directly to your GIS files, so no exports are required.
